

as planned this week we added the functionality that stores user id into local storage(it will be changed),

- after login it sends id and name to main page where it saves into localStorage
- we added form to send comments
- it posts the data (
 - userId: which gets from localStorage,
 - productId: from url value product:{id}
 - comment : from textarea) to sendComment which check if comment empty or not and after checking stores it to out comments table
- to make it easier we rewrite our productPage functoion into 3:
 - renderProductPage main one
 - getProduct to get exact one product full information
 - getComments to get comment to of product
- after comment were sent it just reloaded product page
